

# PriorityPulse

A clinician triage layer that turns Datos' Care Team Dashboard from a data viewer into a prioritized action queue — so care teams know who needs them first.

60%+

of clinicians report EHR/workflow burden as a major driver of burnout

#1

Alert fatigue is the top clinician complaint across all Hospital at Home programs

AHRQ · JMIR · SPRINGER

\$15K

Average cost of a preventable readmission — the outcome HiTH programs exist to reduce

US HEALTHCARE · CMS DATA

Datos automates the patient workflow brilliantly — reminders, education, questionnaires, escalation. But the Care Team Dashboard still shows **data and alerts, not priorities**. Clinicians see trends and notifications. They don't see: "of your 40 home patients, here are the 3 who need you right now and why." The patient side is automated. **The clinician side is still manual.**

THE PROBLEM

Automated patient workflows, manual clinician triage

The Care Team Dashboard shows data trends and fires threshold-based alerts. Every out-of-range reading triggers a notification. Clinicians must review every alert, every patient, every morning — and decide for themselves who matters most. More patients on the platform means more alerts, not more clarity.

THE SOLUTION

One queue. One question answered.

PriorityPulse adds a triage intelligence layer on top of the existing Care Team Dashboard. It synthesizes vitals trends, PROM responses, medication adherence, and silence patterns into a single composite score — then ranks patients into a prioritized morning queue. One screen. "Who do I call first?" answered in under 30 seconds.

HOW THE LOOP WORKS

1

 CareApp prompts daily check-in → 

2

 Patient submits vitals + PROM (or stays silent) → 

3

 Triage engine scores composite risk → 

4

 Dashboard re-ranks queue → 

5

 Care team acts on the right patient first → 

✓

 Earlier intervention · fewer readmissions

THE TWO SURFACES

**Patient: Enhanced CareApp Check-In**

A small upgrade to the existing CareApp — one personalized daily prompt that references yesterday's data. Silence is now a tracked signal, not a void. Built on what already ships.

**Care Team: Priority Dashboard**

A new layer on the Care Team Dashboard that answers one question every morning: who needs me first? Patients ranked by composite risk score + silence duration.

MVP SCOPE

What ships in v1— built on what Datos already has

PriorityPulse isn't a rebuild. The CareApp, the data pipeline, and the Care Team Dashboard already exist. v1 wraps them in a thin triage and prioritization layer that any HiTH program can turn on through the Design Studio.

| V1 CAPABILITY                 | ALREADY EXISTS?                            | WHAT WE ADD                                             |
|-------------------------------|--------------------------------------------|---------------------------------------------------------|
| Daily CareApp check-in prompt | CareApp ships today                        | One-tap "okay / concern" + silence as a tracked signal  |
| Composite triage score        | Threshold alerts exist; no composite score | Weighted score: vitals + PROM + adherence + silence     |
| Prioritized morning queue     | Dashboard shows data trends                | Ranked queue view sorted by composite score             |
| Design Studio configuration   | No-code builder ships today                | New components for score weighting + silence thresholds |
| EMR / device integrations     | Already in place                           | No new integration work in v1                           |

*"I'm drowning in alerts that don't mean anything. I need to know which of my patients actually needs me right now — not see every number that crossed a threshold overnight."*
